

With a computer software package, it is quite easy to sort the data from smallest to largest and to locate percentiles and deciles. Listed below is the MINITAB output. It includes the first and third quartiles, as well as the mean, median, standard deviation, and coefficient of skewness for the Regina and Surrounding area data (see Table 2–1). We conclude that 25 percent of the homes listed for less than \$127,675 and that 75 percent listed for less than \$233,975.

The MINITAB Commands for the summary of the Regina and Surrounding area data are:

- Import the data from the CD. The file name is Table 02–1.
- Use the same commands as in the previous description. The dialog boxes will appear the same.
