

PRACTICE SET

Questions

- Q3-1.** The period of a signal is the inverse of its frequency and vice versa: $T = 1/f$ and $f = 1/T$.
- Q3-3.** *Fourier series* gives the frequency domain of a periodic signal; *Fourier analysis* gives the frequency domain of a nonperiodic signal.
- Q3-5.** *Baseband transmission* means sending a digital or an analog signal without modulation using a low-pass channel. *Broadband transmission* means to modulate signal using a band-pass channel.
- Q3-7.** The *Nyquist theorem* defines the maximum bit rate of a noiseless channel.
- Q3-9.** A fiber-optic cable uses light (very high frequency). Since f is very high, the wavelength, which is $\lambda = c / f$, is very low.
- Q3-11.** The frequency domain of a voice signal is normally *continuous* because voice is a nonperiodic signal.
- Q3-13.** This is *baseband transmission* because no modulation is involved.
- Q3-15.** This is *broadband transmission* because it involves modulation.

Problems

P3-1.

- | | | | | |
|----|-----------|---------------------------|-----------------------------------|-------------------------------|
| a. | $T = 1/f$ | $= 1 / (24 \text{ Hz})$ | $= 0.0417 \text{ s}$ | $= 41.7 \text{ ms}$ |
| b. | $T = 1/f$ | $= 1 / (8 \text{ MHz})$ | $= 0.000000125 \text{ s}$ | $= 0.125 \text{ ns}$ |
| c. | $T = 1/f$ | $= 1 / (140 \text{ kHz})$ | $= 7.14 \times 10^{-6} \text{ s}$ | $= 7.14 \text{ } \mu\text{s}$ |

P3-3.

- a. 90 degrees ($\pi/2$ radians)
- b. 0 degrees (0 radians)
- c. 90 degrees ($\pi/2$ radians) (Note that it is the same wave as in part a.)

P3-5. We know the bandwidth is 2000. The highest frequency must be $100 + 2000 = 2100$ Hz. See below:

**P3-7.**

- a. bit rate = $1 / (\text{bit duration}) = 1 / (0.001 \text{ s}) = 1000 \text{ bps} = 1 \text{ Kbps}$
- b. bit rate = $1 / (\text{bit duration}) = 1 / (2 \text{ ms}) = 500 \text{ bps}$
- c. bit rate = $1 / (\text{bit duration}) = 1 / (20 \mu\text{s}/10) = 1 / (2 \mu\text{s}) = 500 \text{ Kbps}$

P3-9. There are 8 bits in 16 ns. Bit rate is $8 / (16 \times 10^{-9}) = 0.5 \times 10^9 = 500 \text{ Mbps}$

P3-11. The bandwidth is $5 \times 5 = 25 \text{ Hz}$.

P3-13. The signal is nonperiodic, so the frequency domain is made of a continuous spectrum of frequencies as shown below:

P3-15. We can calculate the attenuation as shown below:

$$\text{dB} = 10 \log_{10} (90 / 100) = -0.46 \text{ dB}$$

P3-17. The total gain is $3 \times 4 = 12 \text{ dB}$. To find how much the signal is amplified, we can use the following formula:

$$12 = 10 \log (P_2/P_1) \quad \rightarrow \quad \log (P_2/P_1) = 1.2 \quad \rightarrow \quad P_2/P_1 = 10^{1.2} = 15.85$$

The signal is amplified almost 16 times.

P3-19. $480 \text{ s} \times 300,000 \text{ km/s} = 144,000,000 \text{ km}$

P3-21. We use the Shannon capacity $C = B \log_2 (1 + \text{SNR})$

$$C = 4,000 \log_2 (1 + 1,000) \approx 40 \text{ Kbps}$$

P3-23. The file contains $2,000,000 \times 8 = 16,000,000$ bits.

a. With a 56-Kbps channel, it takes $16,000,000/56,000 = 289 \text{ s} \approx 5$ minutes.

b. With a 1-Mbps channel, it takes $16,000,000/1,000,000 = 16 \text{ s}$.

P3-25. We have

$$\text{SNR} = (200 \text{ mW}) / (10 \times 2 \times \mu\text{W}) = 10,000$$

$$\text{SNR}_{\text{dB}} = 10 \log_{10} \text{SNR} = 10 \log_{10} 10000 = 40$$

P3-27. We can approximately calculate the capacity as

a. $C = B \times (\text{SNR}_{\text{dB}} / 3) = 20 \text{ KHz} \times (40 / 3) = 267 \text{ Kbps}$

b. $C = B \times (\text{SNR}_{\text{dB}} / 3) = 200 \text{ KHz} \times (4 / 3) = 267 \text{ Kbps}$

c. $C = B \times (\text{SNR}_{\text{dB}} / 3) = 1 \text{ MHz} \times (20 / 3) = 6.67 \text{ Mbps}$

P3-29. We can use the approximate formula

$$C = B \times (\text{SNR}_{\text{dB}} / 3) \text{ or } \text{SNR}_{\text{dB}} = (3 \times C) / B$$

We can say that the minimum of SNR_{dB} is

$$\text{SNR}_{\text{dB}} = 3 \times 100 \text{ Kbps} / 4 \text{ KHz} = 75$$

This means that the minimum

$$\text{SNR} = 10^{\text{SNR}_{\text{dB}}/10} = 10^{7.5} \approx 31,622,776$$

P3-31. The bit duration is the inverse of the bandwidth. We have

$$(\text{bit length}) = (\text{propagation speed}) \times (\text{bit duration})$$

a. Bit length = $(2 \times 10^8 \text{ m}) \times [(1 / (1 \text{ Mbps}))] = 200 \text{ m}$. This means a bit occupies 200 meters on a transmission medium.

b. Bit length = $(2 \times 10^8 \text{ m}) \times [(1 / (10 \text{ Mbps}))] = 20 \text{ m}$. This means a bit occupies 20 meters on a transmission medium.

c. Bit length = $(2 \times 10^8 \text{ m}) \times [(1 / (100 \text{ Mbps}))] = 2 \text{ m}$. This means a bit occupies 2 meters on a transmission medium.

P3-33. We have Latency = $\text{Delay}_{\text{pr}} + \text{Delay}_{\text{qu}} + \text{Delay}_{\text{tr}} + \text{Delay}_{\text{pg}}$

$$\text{Delay}_{\text{pr}} = 10 \times 1 \mu\text{s} = 10 \mu\text{s} \quad // \text{ Processing delay}$$

$$\text{Delay}_{\text{qu}} = 10 \times 2 \mu\text{s} = 20 \mu\text{s} \quad // \text{ Queuing delay}$$

$$\text{Delay}_{\text{tr}} = 5,000,000 / (5 \text{ Mbps}) = 1 \text{ s} \quad // \text{ Transmission delay}$$

$$\text{Delay}_{\text{pg}} = (2000 \text{ Km}) / (2 \times 10^8) = 0.01 \text{ s} \quad // \text{ Propagation delay}$$

This means

$$\text{Latency} = 10 \mu\text{s} + 20 \mu\text{s} + 1 \text{ s} + 0.01 \text{ s} \approx 1.01 \text{ s}$$

The transmission time is dominant here because the packet size is huge.
