

## CMOS 8-Stage Presettable Synchronous Down Counters

High-Voltage Types (20-Volt Rating)

CD40102B – 2-Decade BCD Type

CD40103B – 8-Bit Binary Type

■ CD40102B, and CD40103B consist of an 8-stage synchronous down counter with a single output which is active when the internal count is zero. The CD40102B is configured as two cascaded 4-bit BCD counters, and the CD40103B contains a single 8-bit binary counter. Each type has control inputs for enabling or disabling the clock, for clearing the counter to its maximum count, and for presetting the counter either synchronously or asynchronously. All control inputs and the CARRY-OUT/ZERO-DETECT output are active-low logic.

In normal operation, the counter is decremented by one count on each positive transition of the CLOCK. Counting is inhibited when the CARRY-IN/COUNTER ENABLE ( $\overline{CI/CE}$ ) input is high. The CARRY-OUT/ZERO-DETECT ( $\overline{CO/ZD}$ ) output goes low when the count reaches zero if the  $\overline{CI/CE}$  input is low, and remains low for one full clock period.

When the SYNCHRONOUS PRESET-ENABLE ( $\overline{SPE}$ ) input is low, data at the JAM input is clocked into the counter on the next positive clock transition regardless of the state of the  $\overline{CI/CE}$  input. When the ASYNCHRONOUS PRESET-ENABLE ( $\overline{APE}$ ) input is low, data at the JAM inputs is asynchronously forced into the counter regardless of the state of the  $\overline{SPE}$ ,  $\overline{CI/CE}$ , or CLOCK inputs. JAM inputs J0-J7 represent two 4-bit BCD words for the CD40102B and a single 8-bit binary word for the CD40103B. When the CLEAR ( $\overline{CLR}$ ) input is low, the counter is asynchronously cleared to its maximum count (99<sub>10</sub> for the CD40102B and 255<sub>10</sub> for the CD40103B) regardless of the state of any other input. The precedence relationship between control inputs is indicated in the truth table.

If all control inputs except  $\overline{CI/CE}$  are high at the time of zero count, the counters will jump to the maximum count, giving a counting sequence of 100 or 256 clock pulses long.

This causes the  $\overline{CO/ZD}$  output to go low to enable the clock on each succeeding clock pulse.

The CD40102B and CD40103B may be cascaded using the  $\overline{CI/CE}$  input and the  $\overline{CO/ZD}$  output, in either a synchronous or ripple mode as shown in Figs.21 and 22.

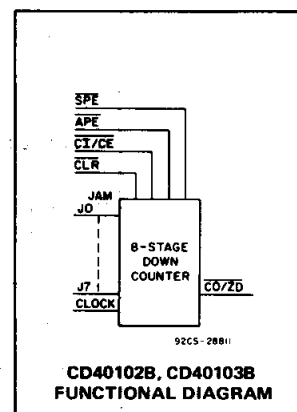

The CD40102B and CD40103B types are supplied in 16-lead hermetic dual-in-line ceramic packages (D and F suffixes), 16-lead dual-in-line plastic packages (E suffix), 16-lead small-outline package (NSR suffix), and in chip form (H suffix).

### Features:

- Synchronous or asynchronous preset
- Medium-speed operation:  $f_{CL} = 3.6$  MHz (typ.) @  $V_{DD} = 10$  V
- Cascadable
- 100% tested for quiescent current at 20 V
- Maximum input current of 1  $\mu$ A at 18 V over full package-temperature range; 100 nA at 18 V and 25°C
- Noise margin (full package-temperature range) = 1 V at  $V_{DD} = 5$  V  
2 V at  $V_{DD} = 10$  V  
2.5 V at  $V_{DD} = 15$  V
- Standardized, symmetrical output characteristics
- 5-V, 10-V, and 15-V parametric ratings
- Meets all requirements of JEDEC Tentative Standard No. 13B, "Standard Specifications for Description of 'B' Series CMOS Devices"

### Applications:

- Divide-by-"N" counters
- Programmable timers
- Interrupt timers
- Cycle/program counter

### RECOMMENDED OPERATING CONDITIONS AT $T_A = 25^\circ\text{C}$ , Unless Otherwise Specified

For maximum reliability, nominal operating conditions should be selected so that operation is always within the following ranges.

\* An output spike (160 ns @  $V_{DD} = 5$  V) occurs whenever two or more devices are cascaded in the parallel-clocked mode because the clock-to-carry out delay is greater than the carry-in-to-carry out delay. This spike is eliminated by gating the output of the last device with the clock as shown.
