Preface v

CHAPTER 1

An Introduction to Ecology 2

- 1.1 Ecology: The Study of Living Interactions 4
 - 1.2 The Scale of Ecology: From Organisms to Ecosystems 5
 - 1.2.1 Organismal ecology investigates how individuals' adaptations and choices affect their reproduction and survival 5
 - 1.2.2 Population ecology describes how populations grow and interact with other species 6
 - 1.2.3 Community ecology focuses on factors that influence the number of species in an area 7
 - 1.2.4 Ecosystems ecology describes the passage of energy and nutrients through communities 7
 - 1.3 The Four Main Elements of Global Change 7
 - 1.3.1 Element 1: Habitat destruction reduces available habitat for wildlife 8
 - 1.3.2 Element 2: Invasive species can cause extinctions of native species 10
 - Feature Investigation** Secretion of Chemicals Gives Some Invasive Plants a Competitive Edge 10
 - 1.3.3 Element 3: Direct exploitation decreases the density of populations 11
 - 1.3.4 Element 4: Pollution may cause global change via climate alterations 12
 - Global Insight** Biological Control Agents May Have Strong Nontarget Effects 13
 - 1.4 Ecological Methods: Observation, Experimentation, and Analysis 14
 - 1.4.1 Experimentation involves manipulating a system and comparing results to an unmanipulated control 16
 - 1.4.2 Experiments can be performed in a laboratory or in the field, or can result from natural phenomena 17
 - 1.4.3 Meta-analysis allows data from similar experiments to be combined 18
 - 1.4.4 Mathematical models can describe ecological phenomena and predict patterns 19
- Summary 20

Test Yourself 20
Conceptual Questions 21
Data Analysis 21

SECTION ONE Organismal Ecology

CHAPTER 2

Population Genetics 24

- 2.1 Evolution Concerns How Species Change over Time 26
 - 2.1.1 Charles Darwin proposed the theory of evolution by natural selection 26
 - 2.1.2 Alfred Russel Wallace was codiscoverer of evolutionary theory 28
 - Global Insight** Pollution Affects Color in the Peppered Moth, *Biston betularia* 28
 - 2.1.3 Gregor Mendel performed classic experiments on the inheritance of traits 30
 - 2.2 Gene and Chromosome Mutations Cause Novel Phenotypes 31
 - 2.2.1 Gene mutations involve changes in the sequence of nucleotide bases 32
 - 2.2.2 Chromosome mutations alter the order of genes 33
 - 2.3 The Hardy-Weinberg Equation Describes Allele and Genotype Frequencies in an Equilibrium Population 33
 - 2.4 Small Populations Cause the Loss of Genetic Diversity 35
 - 2.4.1 Inbreeding is mating between closely related individuals 35
 - Feature Investigation** Inbreeding Increases the Risk of Extinction 36
 - 2.4.2 Genetic drift refers to random changes in allele frequencies over time 38
 - 2.4.3 Knowledge of effective population sizes is vital to conservation efforts 40
- Summary 41
Test Yourself 41
Conceptual Questions 42
Data Analysis 43

CHAPTER 3

Natural Selection, Speciation, and Extinction 44

3.1 Natural Selection Can Follow One of Four Different Pathways 46

- 3.1.1 Directional selection favors phenotypes at one extreme 46
- 3.1.2 Stabilizing selection favors intermediate phenotypes 47
- 3.1.3 Balancing selection promotes genetic diversity 48

Feature Investigation John Losey and Colleagues Demonstrated That Balancing Selection by Opposite Patterns of Parasitism and Predation Can Maintain Different-Colored Forms of Aphids 48

- 3.1.4 Disruptive selection favors the survival of two phenotypes 50

3.2 Speciation Occurs Where Genetically Distinct Groups Separate into Species 50

- 3.2.1 There are many definitions of what constitutes a species 51

Global Insight Hybridization and Extinction 53

- 3.2.2 The main mechanisms of speciation are allopatric speciation and sympatric speciation 54

3.3 Evolution Has Accompanied Geologic Changes on Earth 54

- 3.3.1 Early life caused changes in atmospheric oxygen and carbon dioxide 56
- 3.3.2 The evolution of multicellular organisms also accompanied atmospheric changes 56
- 3.3.3 Modern distribution patterns of plants and animals have been influenced by continental drift 59

3.4 Many Patterns Exist in the Formation and Extinction of Species 63

- 3.4.1 Species formation may be gradual or sporadic 64
- 3.4.2 Patterns of extinction are evident from the fossil record 65
- 3.4.3 Current patterns of extinction have been influenced by humans 65
- 3.4.4 Extinction rates are higher on islands than on the mainland 66
- 3.4.5 Extinctions are most commonly caused by introduced species and habitat destruction 67

3.5 Degree of Endangerment Varies by Taxa, Geographic Location, and Species Characteristics 67

- 3.5.1 Endangered species are not evenly distributed among geographical areas 69
- 3.5.2 Vulnerability to extinction can be linked to species characteristics 70

- Summary 72
- Test Yourself 73
- Conceptual Questions 73
- Data Analysis 73

CHAPTER 4

Behavioral Ecology 74

4.1 Altruism: Behavior That Benefits Others at Personal Cost 76

- 4.1.1 In nature, individual selfish behavior is more likely than altruism 76
- 4.1.2 Altruistic behavior is often associated with kin selection 78
- 4.1.3 Altruism in social insects arises partly from genetics and partly from lifestyle 79
- 4.1.4 Unrelated individuals may behave altruistically if reciprocation is likely 80

4.2 Group Living Has Advantages and Disadvantages 82

- 4.2.1 Living in groups may increase prey vigilance 82
- 4.2.2 Living in groups offers protection by the “selfish herd” 83

Feature Investigation Reto Zach Showed How Large Whelks Are the Optimum Prey Size for Crows 84

4.3 Foraging Behavior: The Search for Food 85

- 4.3.1 Optimal foraging maximizes the benefits and minimizes the costs of food gathering 85

Global Insight The North Atlantic Oscillation Affects Snow Pack, Wolf Behavior, and Moose Predation Rates 86

- 4.3.2 Defending territories has costs and benefits 86
- 4.3.3 Game theory establishes whether individuals fight for resources or flee from opponents 88

4.4 Mating Systems Range from Monogamous to Polygamous 90

- 4.4.1 In promiscuous mating systems, each male or female may mate with multiple partners 91
- 4.4.2 In monogamous mating systems, males and females are paired for at least one reproductive season 91
- 4.4.3 In polygynous mating systems, one male mates with many females 92
- 4.4.4 In polyandrous mating systems, one female mates with many males 93
- 4.4.5 Sexual selection involves mate choice and mate competition 94

- Summary 97
- Test Yourself 97
- Conceptual Questions 98
- Data Analysis 98

SECTION TWO Physiological Ecology

CHAPTER 5

Temperature 102

5.1 The Effects of Cold Temperatures, Especially Freezing, Are Severe 104

5.1.1 Freezing temperatures are lethal for many plant species 106

5.1.2 Animal body size changes in different temperatures 108

5.2 Hot Temperatures Limit Many Species' Distributions 108

5.2.1 Some species depend on fire for their existence 110

5.2.2 Temperature extremes may be more critical than temperature averages 110

5.2.3 Wind can amplify the effects of temperature 112

5.3 The Greenhouse Effect Causes the Earth's Temperature to Rise 112

Global Insight Global Warming Is Changing Species Phenologies 116

Feature Investigation Rachel Hickling and Colleagues Showed the Northerly Limits of a Wide Range of Taxonomic Groups Are Shifting Poleward 117

Summary 118

Test Yourself 119

Data Analysis 119

Conceptual Questions 120

CHAPTER 6

Water 122

6.1 Water Availability Affects Organismal Abundance 124

6.2 Salt Concentrations in Soil and Water Can Be Critical 128

Global Insight Global Warming May Alter Future Global Precipitation Patterns 129

6.3 Soil and Water pH Affect the Distribution of Organisms 131

Feature Investigation Ralph Hames and Colleagues Showed How Acid Rain Has Affected the Distribution of the Wood Thrush in North America 134

Summary 136

Test Yourself 136

Conceptual Questions 136

Data Analysis 137

CHAPTER 7

Nutrients 138

7.1 Soil Development Affects Nutrient Levels 140

7.2 Plant Growth Is Limited by a Variety of Nutrients 142

Feature Investigation Christopher Clark and David Tilman Showed How Low-Level Nitrogen Deposition Has Reduced the Number of Species in Midwest Prairies 144

Global Insight Polluted Areas May Be Restored Using Living Organisms 146

7.3 Herbivore Populations Are Limited by Plant Nutrient Levels 146

7.4 Light Can Be a Limiting Resource for Plants 147

7.5 Carbon Dioxide and Oxygen Availability Limit Organismal Growth and Distributions 149

7.6 Species Distributions Are Often Limited by Multiple Abiotic Factors 150

Summary 152

Test Yourself 152

Conceptual Questions 152

Data Analysis 153

SECTION THREE Population Ecology

CHAPTER 8

Demographic Techniques and Population Patterns 156

8.1 A Variety of Techniques Are Used to Quantify Population Density 158

8.2 Patterns of Spacing May Be Clumped, Uniform, or Random 161

8.3 Fragmented Habitats Affect Spatial Dispersion 163

Global Insight Habitat Destruction Has Radically Changed the Dispersion Patterns of Many Species 164

8.4 Landscape Ecology Concerns the Spatial Arrangement of Habitats and Organisms 165

8.5 Metapopulations Are Separate Populations That Mutually Affect One Another via Dispersal 167

Feature Investigation Joshua Tewksbury Showed How Connecting Habitat Patches via Corridors Facilitated Plant and Animal Movement 168

Summary 171

Test Yourself 171

Conceptual Questions 171

CHAPTER 9

Life Tables and Demography 172

9.1 Age Distributions, Life Tables, and Survivorship Curves Summarize Survival Patterns 174

- 9.1.1 Age distributions reflect survival and mortality patterns 174
- 9.1.2 Static life tables provide a snapshot of a population's age structure from a sample at a given time 174
- 9.1.3 Cohort life tables follow an entire cohort of individuals from birth to death 177
- 9.1.4 Survivorship curves present survival data graphically 177

Feature Investigation Frederick Barkalow, Jr., and Colleagues Constructed a Cohort Life Table for the Eastern Gray Squirrel 178

Global Insight Hunting, Overcollecting, and Grazing Can Greatly Affect Survivorship Curves 181

9.2 Age-Specific Fertility Data Can Tell Us When to Expect Population Growth to Occur 182

- Summary 184
- Test Yourself 185
- Conceptual Questions 185
- Data Analysis 186

CHAPTER 10

Population Growth 188

10.1 Unlimited Population Growth Leads to J-shaped Population Growth Curves 190

- 10.1.1 Geometric growth describes population growth for periodic breeders 190
- 10.1.2 Exponential growth describes population growth for continuous breeders 193

Global Insight Population Growth May Change in Response to Global Warming 195

10.2 Limited Resources Lead to S-Shaped Population Growth Curves 197

- 10.2.1 Logistic growth results in an upper limit to population size 197
- 10.2.2 Time lags can influence whether or not a population reaches an upper limit 199

10.3 Density-Dependent Factors May Limit Population Size 202

10.4 Life History Strategies Incorporate Traits Relating to Survival and Competitive Ability 205

- 10.4.1 Reproductive strategies include reproduction in a single event or continuous breeding 205
- 10.4.2 r and K selection represent two different life history strategies 206
- 10.4.3 Grime's triangle is an alternative to r and K selection 207
- 10.4.4 Population viability analysis uses life history data to predict extinction probability 208

10.5 Human Population Growth 209

- 10.5.1 Human population growth fits an exponential pattern 209
- 10.5.2 Knowledge of a population's age structure helps predict future growth 210
- 10.5.3 Human population fertility rates vary worldwide 210

Feature Investigation Concept of an Ecological Footprint Helps Estimate Carrying Capacity 212

- Summary 214
- Test Yourself 215
- Conceptual Questions 215
- Data Analysis 216

SECTION FOUR Species Interactions

CHAPTER 11

Competition and Coexistence 220

11.1 Several Different Types of Competition Occur in Nature 222

11.2 The Outcome of Competition Can Vary with Changes in the Biotic and Abiotic Environments 223

Feature Investigation Connell's Experiments with Barnacle Species Show That One Species Can Competitively Exclude Another in a Natural Setting 224

11.3 Field Studies Show Interspecific Competition Occurs Frequently 226

- 11.3.1 Invasive species may outcompete native species 229

Global Insight Invasive Rusty Crayfish Have Outcompeted Many Native North American Crayfish 231

- 11.3.2 Competition may occur between biological control agents 231

11.4 The Winners and Losers of Competitive Interactions May Be Predicted Using Mathematical Models 234

- 11.4.1 The Lotka-Volterra competition models are based on the logistic equation of population growth 234

11.4.2 Tilman's R^* models predict the outcome of competition based on resource use 236

11.5 Species May Coexist If They Do Not Occupy Identical Niches 238

11.5.1 Species may partition resources, promoting coexistence 239

11.5.2 Morphological differences may allow species to coexist 241

Summary 244

Test Yourself 244

Conceptual Questions 245

Data Analysis 245

CHAPTER 12

Facilitation 246

12.1 Mutualism Is an Association between Two Species That Benefits Both Species 248

12.1.1 Dispersive mutualism involves dispersal of pollen and seeds 249

12.1.2 Defensive mutualism involves one species defending another in return for a reward 252

12.1.3 Resource-based mutualism involves species that can better obtain resources together than alone 254

Global Insight The Mutualistic Relationships of Humans with Crops and Livestock Have Produced Dramatic Environmental Changes 256

12.1.4 Some mutualisms may be endosymbiotic, where one species lives in the body of another 258

12.1.5 Mutualisms are not easily modeled mathematically 258

12.2 Commensal Relationships Are Those in Which One Partner Receives a Benefit While the Other Is Unaffected 259

12.3 Facilitation May Be More Common under Conditions of Environmental Stress 261

Feature Investigation Calloway's Experiments Show How Positive Interactions among Alpine Plants Increase with Environmental Stress 262

Summary 263

Test Yourself 263

Conceptual Questions 264

Data Analysis 265

CHAPTER 13

Predation 266

13.1 Animals Have Evolved Many Antipredator Adaptations 268

13.2 Predator-Prey Interactions May Be Modeled by Lotka-Volterra Equations 271

13.3 Introduced Predators Show Strong Effects on Native Prey 274

13.4 Native Prey Show Large Responses to Manipulations of Native Predators 277

Feature Investigation Vredenburg's Study Shows That Native Prey Species May Recover after Removal of Exotics 278

13.5 Humans, As Predators, Can Greatly Impact Animal Populations 280

Global Insight Predator-Prey Relationships May Be Altered by Long-Term Climate Changes 281

Summary 285

Test Yourself 285

Conceptual Questions 286

Data Analysis 286

CHAPTER 14

Herbivory 288

14.1 Plants Have a Variety of Defenses Against Herbivores 291

14.1.1 Mechanical defenses include spines and sticky hairs 292

14.1.2 Chemical defenses include alkaloids, phenolics, and terpenoids 292

Feature Investigation José Gómez and Regino Zamora Showed That Thorns Are Induced by Herbivory 292

14.1.3 Induced defenses are turned on by herbivory 295

14.1.4 Chemical defense strategies change according to plant type and environmental conditions 295

14.1.5 Additional plant defenses include production of chemicals which mimic herbivore chemical messengers 297

14.2 Herbivores May Overcome Plant Defenses and Impact Plant Populations 298

14.3 How Much Plant Material Do Herbivores Consume? 300

Global Insight Predator Removal in the United States Has Resulted in Overgrazing by Native Herbivores 302

14.4 Plants Can Have Strong Effects on Herbivore Densities 305

Summary 307

Test Yourself 307

Conceptual Questions 308

Data Analysis 308

CHAPTER 15

Parasitism 310

15.1 Parasites Exhibit a Wide Range of Attributes and Lifestyles 312

- 15.1.1 Parasites can be classified in many different ways 313
- 15.1.2 Many parasite life cycles involve more than one species of host 314
- 15.1.3 Kleptoparasitism involves one species stealing resources from another 316

15.2 Hosts Have Evolved Many Different Types of Defenses Against Parasites 316

15.3 Parasites Can Cause High Mortality in Host Populations 317

- 15.3.1 Parasite-removal studies show how native parasites strongly affect native host populations 318

Feature Investigation Sylvia Hurtrez-Boussès and Colleagues Microwaved Bird Nests to Eliminate Nest Parasites 318

- 15.3.2 Invasive parasites may have even more devastating effects than native parasites 320
- 15.3.3 Some nonnative parasites are introduced deliberately for the biological control of pests 322

Global Insight Rinderpest Caused Massive Mortality in African Wildlife in the 19th Century 323

15.4 Host-Parasite Models Are Different from Predator-Prey Models 324

15.5 Parasitism May Be Increased by Climate Change 325

- Summary 326
- Test Yourself 327
- Conceptual Questions 327
- Data Analysis 328

CHAPTER 16

Population Regulation 330

16.1 Both Top-Down and Bottom-Up Effects Are Important in Natural Systems 332

16.2 Conceptual Models Suggest Top-Down and Bottom-Up Effects Vary in Importance in Different Environments 336

Global Insight Urbanization Can Change the Relative Effects of Top-Down and Bottom-Up Factors 339

16.3 Key Factor Analysis and Indispensable Mortality Are Two Techniques Used to Compare the Strengths of Mortality Factors 340

- 16.3.1 Key factors are those which cause most of the change in population densities 340
- 16.3.2 Indispensable mortality measures the amount of mortality from one factor that cannot be replaced by mortality from another factor 343

Feature Investigation Munir and Sailer Used Key Factor Analysis to Examine the Success of an Imported Biological Control Agent 344

- Summary 347
- Test Yourself 347
- Conceptual Questions 348
- Data Analysis 348

SECTION FIVE Community Ecology

CHAPTER 17

Species Diversity 352

17.1 The Nature of Communities Has Been Debated by Ecologists 354

17.2 A Variety of Indices Have Been Used to Estimate Species Biodiversity 355

- 17.2.1 Dominance indices are more influenced by the numbers of common species 355
- 17.2.2 Information statistic indices are more influenced by the numbers of rare species 357

Feature Investigation Stuart Marsden's Field Studies in Indonesia Showed How Logged Forests Have a Lower Bird Diversity Than Unlogged Forests 358

- 17.2.3 Weighted indices attempt to assess the relative importance of species in a community 361
- 17.2.4 Regional diversity incorporates diversity at many sites 362
- 17.2.5 Evenness is a measure of how diverse a community is relative to the maximum possible diversity 363
- 17.2.6 The effective number of species is a conceptually appealing measure of diversity 364

17.3 Rank Abundance Diagrams Visually Describe the Distribution of Individuals Among Species in Communities 365

- 17.3.1 The lognormal distribution is based on statistical properties of data 365
- 17.3.2 Tokeshi's niche apportionment models provide biological explanations for rank abundance plots 366

17.4 Community Similarity Is a Measure of How Many Species Are Common Between Communities 369

Summary 370

Test Yourself 371

Conceptual Questions 371

Data Analysis 371

CHAPTER 18

Species Richness Patterns 372

18.1 The Species-Time Hypothesis Suggests Communities Diversify with Age 375

18.2 The Species-Area Hypothesis Suggests Large Areas Support More Species 377

18.3 The Species-Energy Hypothesis Suggests That Greater Productivity Permits the Existence of More Species 378

18.4 The Intermediate Disturbance Hypothesis Suggests Species Richness Is Highest in Areas of Intermediate Levels of Disturbance 379

18.5 Natural Enemies Promote Increased Species Richness at Local Levels 380

18.6 Communities in Climatically Similar Habitats May Themselves Be Similar in Species Richness 381

Global Insight Species Richness Could Be Reduced by Changing Climate 382

18.7 Habitat Conservation Focuses on Identifying Countries Rich in Species or Habitats 384

Summary 388

Test Yourself 388

Conceptual Questions 389

Data Analysis 389

CHAPTER 19

Species Richness and Community Services 390

19.1 Five Hypotheses Explain How Species Richness Affects Community Services 393

19.1.1 Recent studies have investigated the relationship between species richness and community function 394

Feature Investigation Shahid Naeem's Ecotron Experiments Showed a Relationship Between Species Richness and Community Services 394

19.1.2 Plant species richness affects herbivore and predator species richness 396

19.1.3 Increased natural enemy species richness increases herbivore suppression 397

19.1.4 The sampling effect is the likely cause of increased performance in species-rich communities 398

Global Insight Overfishing Reduces Fish Species Richness and Increases the Prevalence of Coral Disease 399

19.2 Species-Rich Communities Are More Stable Than Species-Poor Communities 399

19.2.1 A stable community changes little in species richness over time 400

19.2.2 The diversity-stability hypothesis states that species-rich communities are more stable than species-poor communities 401

19.2.3 Species richness affects community resistance to invasion by introduced species 402

19.2.4 Invasive species may possess a variety of special life-history traits 406

Summary 409

Test Yourself 410

Conceptual Questions 410

Data Analysis 410

CHAPTER 20

Succession 412

20.1 Several Mechanisms That Describe Succession Have Been Proposed 414

20.1.1 Facilitation assumes each invading species creates a more favorable habitat for succeeding species 415

Feature Investigation Peter Vitousek and Colleagues Showed How Invasion by an Exotic Tree Changed Soil Nitrogen Levels in Hawaii 417

20.1.2 Inhibition implies that early colonists prevent later arrivals from replacing them 418

20.1.3 Tolerance suggests that early colonists neither facilitate nor inhibit later colonists 418

20.1.4 Facilitation and inhibition may both occur in the same community during succession 419

20.2 Species Richness Often Increases During Succession 421

Global Insight The Pathway of Succession Has Been Changed by a Variety of Human Activities 422

20.3 Restoration Ecology Is Guided by the Theory of Succession 424

Summary 426

Test Yourself 426

Conceptual Questions 427

Data Analysis 427

CHAPTER 21

Island Biogeography 428

21.1 The Theory of Island Biogeography Considers Succession on Islands 430

21.1.1 The species-area hypothesis describes the effect of island size on species richness 432

21.1.2 The species-distance hypothesis describes the effect of island distance on species richness 435

Global Insight Deforestation and the Loss of Species 436

21.1.3 Species turnover on islands is generally low 436

Feature Investigation Simberloff and Wilson's Experiments Tested the Predictions of Island Biogeography Theory 438

21.2 Nature Reserve Designs Incorporate Principles of Island Biogeography and Landscape Ecology 440

Summary 442

Test Yourself 443

Conceptual Questions 443

Data Analysis 444

SECTION SIX Biomes

CHAPTER 22

Terrestrial Biomes 448

22.1 Variation in Solar Radiation Determines the Climate in Different Areas of the World 450

22.2 Terrestrial Biome Types Are Determined by Climate Patterns 456

Global Insight Tropical Deforestation Threatens Many Species with Extinction 460

Global Insight Anthropogenic Biomes of the World 476

Summary 478

Test Yourself 478

Conceptual Questions 479

CHAPTER 23

Marine Biomes 480

23.1 Variations in Ocean Current and Tidal Range 482

23.1.1 Ocean currents are created by winds and the Earth's rotation 482

23.1.2 Waves are also created by the wind 483

23.1.3 Langmuir circulation may carry material deep below the water surface 484

23.1.4 Deep-ocean currents are caused by thermohaline circulation 484

23.1.5 Tides are caused by the gravitational pull of the moon and the sun 484

Global Insight The Effects of Sea Level Rise on Coastal Regions 487

23.2 Marine Biomes Are Determined by Water Temperature, Depth, and Wave Action 488

Summary 498

Test Yourself 498

Conceptual Questions 499

CHAPTER 24

Freshwater Biomes 500

24.1 The Properties of Freshwater Vary Dramatically with Temperature 502

Global Insight Aquatic Fauna in the U.S. Are Threatened by Global Change 505

24.2 Freshwater Biomes Are Determined by Variations in Temperature, Light Availability, Productivity, and Oxygen Content 506

Summary 514

Test Yourself 515

Conceptual Questions 515

SECTION SEVEN Ecosystems Ecology

CHAPTER 25

Food Webs and Energy Flow 518

25.1 The Main Organisms within Food Chains Are Termed Producers, Primary Consumers, and Secondary Consumers 520

25.2 In Most Food Webs, Chain Lengths Are Short and a Pyramid of Numbers Exists 525

25.2.1 Consumption, assimilation, and production efficiencies are measures of ecological efficiency 525

25.2.2 Trophic-level transfer efficiency measures energy flow between trophic levels 526

25.2.3 Ecological pyramids describe the distribution of numbers, biomass, or energy between trophic levels 526

25.2.4 In most food webs connectance decreases with increasing numbers of species 528

Feature Investigation Gary Polis Showed How Real-World Food Webs Are Complex 528

25.3 Within Food Webs Some Species Have Disproportionately Large Effects 530

Global Insight Some Invasive Species May Be Viewed as Cultural Keystone Species 534

Summary 534

Test Yourself 535

Conceptual Questions 535

Data Analysis 536

CHAPTER 26

Biomass Production 538

26.1 Production Is Influenced by Water, Temperature, Nutrients and Light Availability 540

26.1.1 Net primary production in terrestrial ecosystems is limited mainly by water, temperature, and nutrient availability 542

26.1.2 Net primary production in aquatic ecosystems is limited mainly by light and nutrient availability 543

Global Insight Elevated Atmospheric CO₂ Increases Primary Productivity 544

26.1.3 Net primary production varies in different biomes 546

26.1.4 Secondary production is generally limited by available primary production 548

26.2 Decomposition Is Increased by High Temperatures, Soil Moisture, and Soil Nutrients 550

Feature Investigation John Teal Mapped Out Energy Flow in a Georgia Salt Marsh 550

26.3 Living Organisms Can Affect Nutrient Availability 556

Summary 559

Test Yourself 559

Conceptual Questions 560

Data Analysis 560

CHAPTER 27

Biogeochemical Cycles 562

27.1 Biogeochemical Cycles Transfer Elements Among the Biotic and Abiotic Components of Ecosystems 564

27.2 Phosphorus Cycles Locally Between Geological and Biological Components of Ecosystems 564

Global Insight Biomagnification of Pesticides Can Occur in Higher Trophic Levels 566

27.3 Carbon Cycles Among Biological, Geological, and Atmospheric Pools 568

Feature Investigation Stiling and Drake's Experiments with Elevated CO₂ Show an Increase in Plant Growth but a Decrease in Herbivory 570

27.4 The Nitrogen Cycle Is Strongly Influenced by Biological Processes That Transform Nitrogen into Usable Forms 572

27.5 The Sulfur Cycle Is Heavily Influenced by Anthropogenic Effects 574

27.6 The Water Cycle Is Largely a Physical Process of Evaporation and Precipitation 576
