## Example 1 Identify Lines of Symmetry

Determine whether the figure has line symmetry. If so, copy the figure and draw all lines of symmetry.

The figure has one line of symmetry.

## Example 2 Identify Lines of Symmetry

Determine whether the figure has line symmetry. If so, copy the figure and draw all lines of symmetry.

The figure has one line of symmetry.

Example 3 Identify Lines of Symmetry
Determine whether the figure has line symmetry. If so, copy the figure and draw all lines of symmetry.

The figure has no line symmetry.

## Example 4 Reflect a Figure Over the $\boldsymbol{x}$-axis

Triangle $X Y Z$ has vertices $X(-2,4), Y(5,1)$, and $Z(6,2)$. Find the coordinates of $X Y Z$ after a reflection over the $x$-axis. Then graph the figure and its reflected image.

| Vertices of <br> $\triangle \boldsymbol{X} \boldsymbol{Y} \mathbf{Z}$ | Distance <br> from $\boldsymbol{x}$-axis | Vertices of <br> $\triangle \boldsymbol{X}^{\prime} \boldsymbol{Y}^{\prime} \mathbf{Z}^{\prime}$ |
| :---: | :---: | :---: |
| $X(-2,4)$ | 4 | $X^{\prime}(-2,-4)$ |
| $Y(5,1)$ | 1 | $Y^{\prime}(5,-1)$ |
| $Z(6,2)$ | 2 | $Z^{\prime}(6,-2)$ |

Plot the vertices and connect to form $\triangle X Y Z$. The $x$ axis is the line of symmetry. So, the distance from each point on $\triangle X Y Z$ to the line of symmetry is the same as the distance from the line of symmetry to $\triangle X^{\prime} Y^{\prime} Z^{\prime}$.

## Example 5 Reflect a Figure Over the $y$-axis

Quadrilateral $A B C D$ has vertices $A(2,3), B(3,5), C(7,1)$, and $D(5,-2)$. Find the coordinates of $A B C D$ after a reflection over the $y$-axis. Then graph the figure and its reflected image.

| Vertices of <br> quad $\boldsymbol{A} \boldsymbol{B} \boldsymbol{C} \boldsymbol{D}$ | Distance <br> from $\boldsymbol{y}$-axis | Vertices of <br> quad $\boldsymbol{A}^{\prime} \boldsymbol{B}^{\prime} \boldsymbol{C}^{\prime} \boldsymbol{D}^{\prime}$ |
| :---: | :---: | :---: |
| $A(2,3)$ | 2 | $A^{\prime}(-2,3)$ |
| $B(3,5)$ | 3 | $B^{\prime}(-3,5)$ |
| $C(7,1)$ | 7 | $C^{\prime}(-7,1)$ |
| $D(5,-2)$ | 5 | $D^{\prime}(-5,-2)$ |

Plot the vertices and connect to form quadrilateral $A B C D$. The $y$-axis is the line of symmetry. So, the distance from each point on quadrilateral $A B C D$ to the line of symmetry is the same as the distance from the line of symmetry to quadrilateral $A^{\prime} B^{\prime} C^{\prime} D^{\prime}$.
