

main points

- Acid rain is a result of automobile and industrial smoke-stack emissions.
- The chemistry of acid rain is fairly well understood.
- Acid rain has had important and measurable ecological consequences.
- As a result of weather patterns, acid rain-causing gases spread great distances from their sources, making acid rain a global rather than local issue of concern.
- There are several technologies available for reducing sulfur and nitrogen oxide emissions.
- There is a constant tension between the environmental consequences of our industrial economy and our modern lifestyle.
